

Redesign the Misleading Colored Chart

R.No: 39 Reg. No: 192424231 Name: VEMULA JASWANTH

Each chart below uses color in a misleading or confusing way. For each one, answer the three questions in your own words.

Chart 1

1. What is this chart trying to show?

It shows how many people gave each rating in a product review survey: Disagree (about 37), Neutral (about 72), Agree (about 75) and Strongly Agree (about 50). It is meant to compare how opinions are spread across an ordered scale from negative to positive.

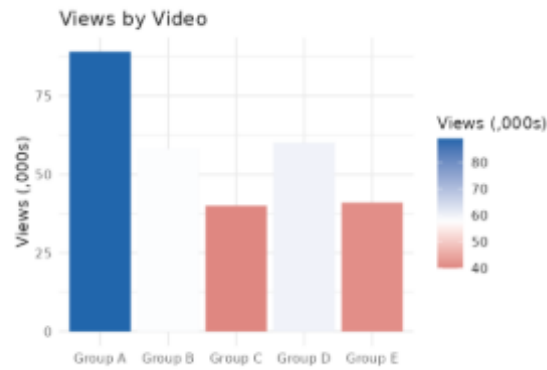

2. What's wrong with the color choice?

The four bars use unrelated rainbow colors (blue, purple, red, green) for categories that have a natural order, so the colors do not show the negative-to-positive progression. Red normally means bad or warning, but here it marks "Agree", a positive answer, so it sends the wrong message and pulls the eye to that bar. Red next to green is also hard to tell apart for color-blind viewers.

3. Propose a better color scheme (describe it in words):

Use a diverging palette that follows the meaning of the scale: orange for Disagree, light grey for Neutral, then light blue for Agree and dark blue for Strongly Agree (darker means a stronger opinion). Another option is one hue, such as blue, going from light to dark in the order Disagree to Strongly Agree. Keep the categories in order and use a color-blind-safe blue/orange pair instead of red/green.

Chart 2

1. What is this chart trying to show?

It compares the number of views (in thousands) for five video groups, A to E. Group A has the most views (about 88k), Group D has about 60k, Group B about 57k, and Groups C and E about 40k each.

2. What's wrong with the color choice?

A diverging blue-white-red scale is used for a simple quantity (views) that only goes from low to high. The white midpoint (around 60k) is arbitrary and suggests a good-versus-bad split that does not exist. Bars near the midpoint, like Group B and Group D, are almost white and fade into the background, so Group B looks empty. The color also repeats what the bar height already shows and needs a legend to decode.

3. Propose a better color scheme (describe it in words):

Use one neutral color, such as a single medium blue, for all bars, because the bar length already shows the values. If emphasis is needed, highlight only Group A in a strong accent color and show the other groups in mid-grey. If a gradient is wanted, use a single-hue sequential scale from light blue to dark blue where even the lightest shade is clearly visible on a white background, and add value labels on the bars.
